

Do you currently use gas cylinders?

Do you think that gas cylinders are the most effective solution?

Historically many companies have used gas cylinders for a wide range of processes, however heavy high pressure cylinders may not be as good an option as you think. Consider the following: -

The cost of run outs – The implications of gas run outs can be very frustrating and more importantly can cost you time and money. When a cylinder runs out you may have a significant amount of downtime or even product that will require scrapping or reworking, seriously affecting your site efficiency.

The actual cost of your gas – To combat this many companies changeover cylinders early to avoid run outs. The common result is that by doing this you only realise 80-85 per cent of the gas in each of the cylinders you use, yet 100 per cent is still being paid for!

The cost of deliveries – As a cylinder user, you are probably reliant upon manual re-ordering from your existing supplier. This has several disadvantages in that orders may be placed either too early (resulting in unused gas being returned to the supplier) or too late, when an emergency delivery may be required, which normally incurs an additional surcharge over the normal delivery fee.

The Health & Safety implications – There are obvious manual handling issues with the movement of cylinders and the injuries they can cause to both you and your staff. For example, a typical cylinder contains gas at 200 bar - 100 times more than the pressure in a car tyre. This can be extremely dangerous if accidentally released.

Still think gas cylinders are an effective supply for your gas? The good news is that over the page there is a viable and cost effective alternative from CryoService....

THINK AGAIN!

At CryoService, we believe in providing you with gas storage solutions that deliver efficiencies to your site, whilst also saving you money. That is why we have developed a range of portable storage tank solutions to specifically meet the demands of the cylinder market.

No more run outs – Our storage tank solutions provide you far greater capacity on site with our compact 180L tank equalling the same capacity of up to 11 large cylinders. This extra storage means a far greater ability to deal with peak demands.

You only pay for the gas you use – With our system you only pay for the gas delivered as there is no requirement for changeover or returning unused gas in cylinders.

Deliveries managed and reduced – Having a larger storage tank on site means less deliveries. We also have a managed gas system where we monitor your gas usage and change the delivery frequency accordingly.

Improved Health & Safety – Many of our tanks are mobile and can be transported around your site without causing injuries to you or your staff and subsequently reduces the risk of accidental damage. Liquid storage tanks also operate at lower pressures than cylinders and fixed installations reduce the risks associated with connection and disconnection.

Not only do we deliver all of these benefits and potential cost savings but our system is also competitively priced against the current charging structures you have for gas cylinder supply.

If you are interested in talking further about the benefits of using a CryoService system, please contact our Sales Support Office on **01905 758200** or Martin Monaghan on **07900 521907**.
